Motivation for joining HackerFab

I am Adikrit Rahul. My main reason for joining hackerfab is due to my interest in the fields of semiconductors and electricity.

Semiconductors always seem like a very cool concept for me, and the fact that they build the major components of things we use in our everyday life is a big deal. Making India a huge piece of the semiconductor market seems like a mission where I can contribute because I am also studying electrical and I am interested in this field hackerfab seems like a great platform for me to understand how these things work and go into actually building things, which produce them.

Making things cheaper but still precise and easier to fiddle with for interested students is an idea I resonate with. Learning how to build something and reiterate till you find success is also something I want to learn and hacker. Fab seems to be the best opportunity to do so because of the freedom that they provide in terms of money and project selection.

These are the main reasons and my motivation for joining hackerfab.
